AgentPay makes trusted agent execution possible.

Ace is the flagship product proving it live in travel, while the same rails can power enterprise workflows and the wider agent ecosystem.

Identity | Policy | Execution | Verification | Trust

PLATFORM COMPANY

AgentPay

Not a protocol deck with no product. Not a travel app with a pretty face. A platform with real modules and a living reference implementation.

Ace Travel	Flagship trust surface. Live consumer proof.
Operator Workflows	Recurring admin teams with proof and payout control.

WHAT THIS DECK SHOULD MAKE OBVIOUS

The modules are real.

Identity, policy, settlement, receipts, and trust already exist as a coherent system.

Ace is the proof.

Travel is the flagship wedge for showing trusted execution to humans.

The ecosystem is credible.

The same rails fit operator teams, enterprise agents, and future developers.

Focus still matters.

Ace stays travel-first. Expansion comes through disciplined proof points.

THE GAP

AI can understand intent. It still cannot safely act.

Most products stop at recommendation. They do not know who the agent is, what it is allowed to do, how approval works, how payment is governed, or how completion is verified after money moves.

Understanding

Models can interpret nuanced requests in natural language.

Permission

No reliable identity, delegated limits, or approval chain.

Execution

No clean way to reserve budget, pay, and own the workflow.

Verification

No evidence trail, receipt spine, or auditable completion state.

Trust

When something goes wrong, nobody knows who is accountable.

AgentPay exists in that gap. It turns agents from suggestion engines into controlled, attributable, and verifiable actors.

THE MODULES

Five modules turn agents from chat into infrastructure.

01

Identity

Every agent has a verifiable identity and a clear boundary around who is acting.

AGT_* IDS
SIGNED KEYS
MERCHANT AND AGENT REGISTRATION

02

Policy

Permissions, approval rules, spend limits, and escalation paths are programmable instead of improvised.

POLICY CHECKS
LIMITS AND APPROVALS
BIOMETRIC GATES

03

Execution

Agents can initiate, hold, release, and settle work without losing control of the commercial flow.

INTENTS
ESCROW AND FEE LEDGER
SETTLEMENT FLOW

04

Verification

Every action can produce proof, receipts, and a recoverable state after execution.

RECEIPTS
VERIFY ENDPOINTS
RESOLUTION STATE

05

Trust

Reputation and outcomes compound over time so the best agents and operators become more defensible.

TRUST EVENTS
AGENTRANK
MARKETPLACE SURFACES

The point of the company is not one flashy interface. It is making these modules reusable across every workflow where an agent needs to book, pay, verify, or be trusted.

THE ECOSYSTEM

One platform. Multiple trust surfaces.

FLAGSHIP
Ace
Luxury voice-first travel concierge. The live consumer proof that people will delegate real outcomes to an agent.

ENTERPRISE
Team Agent
Travel desks and internal assistants that need approval, payment control, and auditable execution.

VERTICAL
Revenue Ops Agent
Recurring admin teams such as billing or claims operations where proof, SLA control, and payout release matter.

DEVELOPER
Partner Agents
Third-party agents that book, pay, verify, or settle on the same rails without rebuilding trust from scratch.

AgentPay

A programmable layer for identity, policy, payment, verification, and trust. Ace proves it to humans. The ecosystem compounds it across industries.

THE FLAGSHIP

Ace is the living reference implementation. Not a concept. Not a skin.

Ace exists so the world can see what AgentPay feels like when it is wrapped in a product relationship a human will actually trust.

STEP 01
Ask once
Voice-first request capture with route memory, preferences, and travel context.

STEP 02
Recommend clearly
Ace resolves the strongest journey instead of throwing the user into a search maze.

STEP 03
Approve safely
Biometric confirmation and policy checks before money moves.

STEP 04
Book and pay
Voice to payment to receipt, with live references and journey continuity.

STEP 05
Recover when plans break
Disruption polling, push alerts, countdowns, and recovery logic after checkout.

UK rail live · India rail live · Darwin disruption polling · Biometric payment gate · Receipts and QR journey mode

WHY ACE MATTERS

Ace is how AgentPay stops being a protocol thesis and becomes a trust product.

WHAT ACE PROVES	WHY IT MATTERS TO THE PLATFORM
Human trust	Consumers will delegate real money and real outcomes when the experience is calm, explicit, and continuous.
Reference implementation	Developers and partners can see the full trust loop in production instead of reading a conceptual protocol deck.
Design language	The behavior, receipts, approvals, and recovery patterns become the standard for every future agent built on the rails.
Distribution	Ace is the consumer edge that makes the infrastructure legible while creating its own revenue and data advantage.

Ace is not beside AgentPay in a vague brand sense. Ace is the flagship execution surface that proves the modules, sharpens them, and makes the protocol real.

A team of 30 doing recurring admin work is also a natural AgentPay buyer.

The same stack that powers Ace can power high-friction operator workflows where managers need visibility, policy control, proof of completion, and payout release only when work is actually done.

THE WORKFLOW PATTERN

Assign work	Create a work intent with SLA and amount at risk.
Set policy	Who can act, when it escalates, what requires sign-off.
Submit proof	Evidence that the task was actually completed.
Release payout	Funds move only when the outcome is verified.
Compound trust	Turn performance into scorecards and routing advantage.

WHERE IT FITS IMMEDIATELY

Billing administration

Eligibility, denial follow-up, payment posting, and vendor payout control.

Travel operations

Approvals, booking authority, receipts, and disruption handling for teams.

Procurement ops

Milestone release, proof, and accountable commercial handoffs.

Why now

Managers can see throughput, errors, and payouts without trusting a black box.

THE COMPANY SHAPE

Three proofs, one architecture.

PROOF POINT	WHAT IT PROVES
Ace Travel	Consumers will trust a visible agent to plan, pay, confirm, and recover real-world journeys.
Operator Teams	Businesses will use the same rails to control work, verify outcomes, and settle recurring operational workflows.
Partner Agents	Developers and enterprise teams can build on the modules instead of rebuilding trust, payment, and verification from scratch.

The sequencing is the strategy. Travel remains the emotional wedge. Parallel operator workflows validate the modules commercially. External agents come after those proofs are undeniable.

GO TO MARKET

Build the platform in public, without losing focus.

NOW

Ace travel wedge

- Founder-led pilots for frequent travellers and premium teams
- Make the travel loop feel inevitable: flights, hotels, receipts, team workflows
- Use Ace as the live trust surface for the entire company

PARALLEL

Operator design partners

- Start with 10 to 50 seat recurring admin teams
- Focus on workflows that need proof, policy, and payout release
- Productize the modules without turning Ace into a generic SaaS shell

AFTER PROOF

Developer ecosystem

- Expose the clean AgentPay rails to external agents
- Turn the flagship behavior into the protocol standard
- Earn on execution regardless of which agent runs the workflow

BUSINESS MODEL

Three revenue engines. One trust architecture.

Ace direct	- Booking margin, premium subscriptions, and team plans anchored in travel. - This creates the relationship layer and the flagship proof.
Workflow software	- Seat-based or platform pricing for businesses using AgentPay to route work. - Proof, policy, and payout release become measurable software value.
Protocol revenue	- Execution fees, developer access, and partner licensing once external agents run on the same rails. - Revenue compounds underneath every successful agent relationship.

Ace monetizes the user relationship first. AgentPay compounds underneath every agent relationship after that.

WHY THIS CAN WIN

The strongest thing here is not the demo. It is the seam.

Real

Not a blank protocol

Ace already exercises the trust loop with voice, payments, receipts, disruption handling, and continuity.

Shared

Modules compound

The same identity, policy, verification, and payout rails fit both consumer travel and enterprise operator workflows.

Owned

Trust is the product

The company is not competing on chat UX alone. It is competing on delegated execution with accountability.

Expandable

Platform after proof

The ecosystem story gets stronger as each wedge proves the same modules in a new trust context.

This raise funds three proof points that make the ecosystem story obvious.

[X]

Active TestFlight users

People already using Ace in real travel situations rather than staged demos.

[X]

Completed journeys

Voice to receipt loops that prove the flagship works end to end.

[X]

Pilot companies

Teams validating Ace as a premium travel workflow, not just a consumer curiosity.

[X]

Design partners

Operator teams ready to validate the platform modules in recurring admin workflows.

THE RAISE

GBP [X]

Fund 18 months to make Ace world-class in travel, productize AgentPay's core modules for operator workflows, and prepare the rails for the first external agents.

WHAT THIS ROUND MUST PROVE

- Ace becomes the default trust interface for premium travel teams and frequent travellers.
- AgentPay lands its first recurring workflow design partners outside the flagship product.
- The core modules are clean enough to open to partner agents without rebuilding the architecture.

CLOSE

AgentPay is the trust rail.
Ace is the living proof.

Travel comes first because that is where the relationship becomes real. The ecosystem compounds because the underlying modules already know how to identify, approve, execute, verify, and settle work.

Product first. Platform second. Same company. Right order.

Travel first

Operator proof next

Developer ecosystem after proof
